Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments are not persuasive. Applicant points out that the Wigstrom sensor is scanned relative to the outlets of the microchannels such that the sensor is exposed to a plurality of fluid streams emerging thereform, and that during detection, at the microchannel outlets, the fluid streams flow at a uniform rate at steady state concentrations. Applicant argues that any titling of the Wigstrom substrate, whether to scan a sensor across the emerging fluid streams or to impart flow to those streams cannot reduce the amount of liquid during a detection. Applicant's arguments however are not persuasive because these arguments relate to intended use, and Applicant's claims are directed to a device. Thus, the prior art does not need to teach or suggest the method. The claimed langauge must result in a structural difference between the prior art and the present claims. Put another way, the prior art device only needs to be capable of performing the intended use in order to meet the claims. In this case, the Wigstrom device is capable of performing the intended use because the substrate is capable of being tilted, and the sensor and/or the substrate can be moved in an X-, Y- and/or Z- direction, and thus the sensor can detect any part of the substrate during any tilting. Therefore the claims remain rejected for the same reasons of record.
